

## DEVELOP A PYTHON SCRIPT

<i>Team ID</i>	<i>PNT2022TMID48488</i>
<i>Project Name</i>	<i>Smart waste management system for metropolitan cities</i>

*Step 1: Open python idle*

*Step2: Type the program*

*Step 3: Then click on file and save the document*

*Step 4: Then click on Run then Run Module*

*Step 5: output will be appeared in the idle window*

### ***PYTHON SCRIPT***

```
import requests
import json
import ibmiotf.application
import ibmiotf.device
import time
import random
import sys
```

```
# watson device details
```

```
organization = "4yi0vc"
devicType = "BIN1"
deviceId = "BIN1ID"
authMethod= "token"
authToken= "123456789"
```

```

#generate random values for randomo variables (temperature&humidity)
def myCommandCallback(cmd):global a

success=deviceCli.publishEvent ("IoTSensor","json",data,qos=0,on_publish= myOnPublishCallback)

if not success:
    print("not connected to ibmiot")
time.sleep(30)
deviceCli.commandCallback=myCommandCallback
#disconnect the device
deviceCli.disconnect

```

# Screenshots Python script:

The image displays four screenshots of a Python script, likely for an IoT application using IBM Watson IoT. The script is written in Python 3.7.4 and is titled 'b04.py - F:\Desktop\bin\py (3.7.4)'. The code is organized into several sections: imports, device details, random variable generation, and a command callback function.

```
import requests
import json
import ibmiotf.application
import ibmiotf.device
import time
import random
import sys

# Watson device details
organization = "4y10vc"
deviceType = "BIN1"
deviceId = "BIN1ID"
authMethod = "token"
authToken = "123456789"

#Generate random values for random variables (temperature, humidity)

def myCommandCallback(cmd):
    global a
    print("Command received: %s" % cmd.data['command'])
    control=cmd.data['command']
    print(control)

    try:
        deviceOptions={"org": organization, "type": deviceType, "id": deviceId, "auth-method": authMethod, "auth-token": authToken}
        deviceCli = ibmiotf.device.Client(deviceOptions)
    except Exception as e:
        print("Caught exception connecting device %s" % str(e))
        sys.exit()

#connect and send a datapoint "temp" with value integer value into the cloud as a type of event for every 10 seconds
deviceCli.connect()

while True:
    distance= random.randint(10,70)
    loadcell= random.randint(5,15)
    data= {'dist': distance, 'load': loadcell}
```

The script also includes a section for generating random values for variables like temperature and humidity, and a command callback function that handles incoming commands and sends data to the cloud. The code is commented with various messages, such as "Risk warning: No need to collect right now" and "Risk warning: Dumpster is above 60%".
